

DecisionInvitation: a neuroinclusive decision instrument

Designed for minds that do their best thinking with context,
time, and a clear next step.

Catalyst of analysis.

A product and market case for turning independent thought into accountable motion—without turning neurodivergence into a diagnosis gate or a marketing claim.

PROPOSAL 0.4.0 / OWNER REVIEW PENDING

The opportunity is a category boundary.

Not another planner, poll, meeting tool, or consensus platform.

DecisionInvitation can own a narrow but consequential transition: from a cognitively and socially noisy question to independent perspectives, explicit conditions, and a clear next move held by a named decision owner.

Its neurodivergence story is structural, not clinical. Externalized context, asynchronous contribution, visible stages, resumable work, literal language, and explicit ownership align with cognitive-accessibility guidance and common accommodations.[1–6][10–14]

Those mechanisms may reduce avoidable cognitive and social load. They do not establish that the product treats executive dysfunction, changes symptoms, or guarantees better decisions.

Strategic line

Designed for minds that do their best thinking with context, time, and a clear next step.

Inclusive promise: Neuroinclusive by design. Useful for anyone deciding under cognitive load.

A decision is many executive tasks at once.

Do not make good judgment depend on memory, rapid turn-taking, interruption tolerance, or performed certainty.

A consequential decision can require a person to retain context, compare options, predict consequences, inhibit a premature response, shift perspective, communicate a position, remember a deadline, and initiate the next action.

Adult ADHD meta-analyses report group-level differences across working memory, inhibition, set shifting, and planning, with meaningful heterogeneity.[1][2] Research on autistic adults also shows mixed profiles: differences in flexibility or working memory may coexist with planning and decision-making strengths.[3][4]

The design conclusion is not that neurodivergent people cannot decide. It is that the environment should carry avoidable load so judgment can remain visible.

Choice paralysis also is not explained by option count alone. Choice-overload effects depend on complexity, task difficulty, preference uncertainty, and decision goal.[7]

Five moves turn analysis into motion.

MOVE	DESIGN BEHAVIOR	VALUE
Externalize	One bounded question; context, owner, audience, time and deadline up front	Less reconstruction from memory
Separate	Independent asynchronous response before cross-participant influence	Less turn-taking and social-performance load
Qualify	Yes if, no unless, not yet, and need information	Conditions become decision data
Resume	Autosave, visible state, save-and-return, controlled reminders	Interruption need not erase progress
Close	Owner records decision or threshold, rationale and next action	Responsibility stays explicit

Cognitive offloading can reduce internal memory demand, but the external record must remain available and trustworthy.[5] Clear-step guidance emphasizes orientation and re-entry after distraction.[10][11]

Build access into the default path.

Diagnosis is never the price of useful structure.

Orient before asking: task, reason, audience, time, visibility, deadline.

One cognitive job at a time: understand, respond, review, commit.

Preserve unfinished thought: autosave, receipt, obvious re-entry.

Allow depth without requiring it: concise and detailed response paths.

Normalize conditionality: missing information is useful decision data.

Remove shame from reminders: factual language and user-controlled cadence.

Keep language literal and calm; avoid urgency theater and ambiguous state.

Disclose social boundaries before contribution.

Support keyboard, screen readers, zoom, focus visibility and reduced motion.

Return agency to the owner: the system clarifies; a person decides.

The product connects four things competitors split apart.

Independent input

Contributors can think without a meeting or shared-thread performance.

Decision-grade structure

Responses preserve reason, condition, uncertainty and missing facts—not merely a vote.

Explicit authority

The workflow says who owns the call rather than laundering it through “the group.”

Forward condition

Success can be a decision, a threshold, or the next fact required—not forced certainty.

That combination turns Catalyst of analysis. from a slogan into product behavior: analysis is respected, bounded, and connected to action.

The market is a ring of adjacent categories.

CATEGORY / EXAMPLES	THEIR CENTER	DECISIONINVITATION WEDGE
Collective governance Loomio	Group discussion, proposals, polls, outcomes	Independent advice to a named owner
Workshop collaboration GroupMap, Miro	Facilitation, brainstorming, voting, consensus	One calm decision outside the workshop
Polls and forms Polly, Typeform, Slido	Collection, engagement, tallying	Reasoning, conditions, ownership and closure
Neuroinclusive planners Tiimo, Goblin Tools	Individual structure and task support	Multi-person handoff from thought to decision
Work execution Sunsama, Motion	Planning, timeboxing and scheduling	The earlier moment when action is not yet settled

The closest strategic competitor is Loomio. To remain distinct, DecisionInvitation must not collapse into a smaller poll product; its workflow must preserve conditions, dissent, attribution boundaries and owner accountability.[18–24]

Between personal planning and collective governance.

A calm, asynchronous protocol for collecting independent judgment and converting it into an accountable next move.

Tiimo and Goblin Tools directly address individual structure and complexity.[30–34] Loomio and GroupMap organize collective input and decisions.[18–23] Typeform and Polly make collection easy.[25–29] Sunsama and Motion help execute work that has already been chosen.[35–37]

DecisionInvitation can own the transition none of these centers: the handoff from several private, independently formed perspectives to one responsible decision owner.

Category: Decision instrument

Job: Turn distributed judgment into a legible next move.

Distinctive protocol: Ask separately preserve reasoning expose conditions decide visibly.

Moat: A trusted workflow and evidence model—not a feature checklist or AI-generated summary.

Talk about conditions, not diagnoses.

Use

Designed for minds that do their best thinking with context, time, and a clear next step.

Neuroinclusive by design. Useful for anyone deciding under cognitive load.

Different minds need different conditions for contributing.

Make room for thinking. Make the next move visible.

Avoid

Treats executive dysfunction.

Built for every neurodivergent brain.

Clinically proven to improve decisions.

Eliminates ADHD paralysis.

Bias-free, confidential, private, or anonymous without verified definitions.

The existing verbal foundation remains intact: Catalyst of analysis. Better input. Clearer decisions. A quieter way to decide. Ask separately. Decide clearly.

The promise must become observable behavior.

One bounded decision per invitation, with a plain-language question.

Preview of purpose, effort, visibility, owner and deadline.

Autosave plus a durable receipt; no disappearing work.

Save-and-return with a visible step and state indicator.

Response states for yes, no, not yet, yes if, no unless and need information.

Structured prompts for position, reason, condition, risk and missing fact.

Controlled reminders with factual, non-shaming language.

Owner view that preserves attribution, dissent and uncertainty.

Final owner decision or threshold, rationale, next action and accountable person.

Keyboard, screen-reader, zoom, contrast, focus and reduced-motion acceptance.

The orange provenance dot must never become an urgency, error, completion, or attention signal.

Mechanism evidence is not product efficacy.

The research supports why these design choices matter. It does not prove what DecisionInvitation achieves.

No direct study currently establishes that DecisionInvitation improves executive function, reduces ADHD or autistic distress, raises decision quality, or shortens time to decision.

Permitted: “Designed to reduce avoidable cognitive and social load.”

Conditional on implementation: “Supports asynchronous, structured contribution.”

Conditional on implementation and participatory testing: “Neuroinclusive by design.”

Prohibited without direct evidence: treatment, symptom reduction, clinical proof, universal inclusion, guaranteed outcomes, and claims of anonymity, confidentiality, security or compliance.

Private is not anonymous. Synthesis is not truth. A recommendation is not a decision. A local build is not a live deployment.

Invite neurodivergent people into the design authority.

Conduct paid participatory research with diagnosed and self-identified ADHD and autistic adults, alongside a broader comparison sample. Compare the structured flow with a shared thread, live meeting, or general form.

Comprehension without clarification; time to first meaningful response.

Completion, abandonment and return-after-interruption rates.

Unsubmitted or lost work and number of clarification requests.

Contributor confidence that reasoning was represented.

Owner ability to identify dissent, conditions and missing facts.

Time to a recorded next move and perceived cognitive/social load.

Keyboard, screen-reader, zoom, focus and reduced-motion failures.

Interviews should explain why a measure changed. Report subgroup sizes, attrition, limitations and adverse experiences. Do not convert preference findings into clinical claims.
